

A

Preparation and query path

static extraction: parsers only, no model call

parsers rank files and resolve imports;
Tree-sitter and Joern supply structure

queryable store, filled once per task

computations and result anchors; conditions;
definitions; call boundaries with providers

endpoints beside the ordinary shell tools

science_find / inspect / note

Prepared once per task, queried on demand, same budget as the B

B

Recorded payloads

boundary record, task 103, shell.py:1005

```
{"callee": "radians", "code": "np.radians(thetad)",  
  "boundary": {"kind": "external",  
               "provider": "numpy",  
               "assume": "correct_interface",  
               "repair_scope": "caller_file"}}
```

search response: targets first, no verdict

```
{"status": "ok", "matches": [{"target": ...,  
  "excerpt": ..., "kind": "scientific_node"}],  
  "scope": "Lexical discovery, not a verdict."}
```

the same call without the store

```
grep -rn "radians" .      # provider inferred by hand
```
